JIAJIE JIAN

174 Shazheng Street, Shapingba District, Chongqing 400044

Phone: +86 136-5802-2206, Email: jiajiejian02@gmail.com, Website: jace-or-jian.github.io

EDUCATION

◦ **Chongqing University** Chongqing, China

Master of Information and Communication Engineering Sep. 2024 – Expected Jun. 2027

- **Co-advisors:** Prof. Shu Fu & Prof. Min Liu
- **Overall average:** 88.57/100
- **Selected Coursework:** Modern Signal Processing, Information Theory and Coding, Deep Learning, Radar Systems and Signal Processing

◦ **Sichuan Normal University** Chengdu, China

Bachelor of Electronic Information Engineering Sep. 2020 – Jun. 2024

- **Overall average:** 84.16/100
- **Selected Coursework:** Signals and Systems, Digital Signal Processing, Principles of Communications, Probability and Statistics, Linear Algebra

RESEARCH INTERESTS

Integrated Sensing and Communications (ISAC); Physical-Layer Security; Machine Learning for Wireless Communications; Optimization Theory; Statistical Signal Processing.

RESEARCH EXPERIENCE

◦ **Sensing-Guided Beamforming for MIMO-ISAC under Unknown Jamming [M2]** Feb. 2026 – Present

- Developed a sensing-guided beamforming framework that uses sensing observations to construct a spatial interference surrogate and mitigate communication and tracking degradation under unknown jamming.
- Exploited Kronecker structure to reduce the joint communication–sensing beam update to a search over two dual variables, decreasing problem dimensionality by more than **95%** and runtime by more than **86%** relative to a direct CVX implementation.
- Built a lightweight learning-based selector that adaptively configures defense parameters based on sensing feedback, yielding an **18%** gain in effective sum rate over fixed robust designs under reactive jamming.
- Compared the method with representative baselines and conducted ablation studies across jamming intensities, showing null broadening and dedicated sensing degrees of freedom as major contributors to robustness against unknown jamming.

- **Risk-Aware UAV Trajectory and Scheduling for Wireless Service [M1]** Sep. 2025 – Present
  - Designed a joint trajectory-and-scheduling framework for UAV service under constrained mobility, balancing reliable connectivity with mission-wide control of unintended RF leakage near regulated areas.
  - Developed a mission-level RF-leakage risk model beyond average exposure metrics, converting slot-level exposure events into an additive budget that links spatial, temporal, and transmission decisions.
  - Exploited the budget's additive structure to derive closed-form per-slot scheduling updates via Lagrangian relaxation, then jointly updated trajectory, rate, and leakage variables through convex approximation.
  - Evaluated the joint design through key-parameter sweeps and 2-D visualizations of optimized UAV trajectories and user scheduling, achieving >**40%** total spectral efficiency gains over heuristic scheduling and about **15%** over an optimized fixed-trajectory baseline.
- **Diffusion-Assisted EKF Tracking for UAV-ISAC Beam Alignment** Mar. 2026 – Jun. 2026
  - Augmented an EKF tracker with a diffusion model for agile UAV maneuvers, using historical states to forecast nonlinear motion and reduce tracking drift.
  - Used normalized innovation squared (NIS) as an online control signal to adapt DDIM denoising depth in response to model mismatch, suppressing drift while avoiding unnecessary denoising steps.
  - Implemented an end-to-end PyTorch pipeline spanning model training, DDIM inference, and EKF integration, and contributed the resulting state-estimation module to a collaborative UAV-ISAC beamforming study.
  - Validated the method on 50 deterministic UAV trajectories, reducing position and angular RMSE by at least **54%** in forecasting and approximately **20–27%** in continuous tracking relative to EKF; these gains improved multi-step beam alignment, increasing normalized beamforming gain from **0.892** to **0.991** and reducing 1-dB outage from **13.7%** to **0.8%**.
- **Joint Transceiver Design for Secure Full-Duplex ISAC [J1]** Dec. 2024 – Aug. 2025
  - Developed a joint FD-ISAC transceiver design for bidirectional security, mitigating radar-induced downlink exposure while balancing the masking benefit of public traffic against its interference cost for uplink protection.
  - Exploited detection-metric monotonicity to decouple surveillance-channel uncertainty from beamforming–power optimization, reformulated robust constraints as linear matrix inequalities via the S-procedure, and approximated the remaining nonconvex terms with tight convex surrogates.
  - Derived a zero-forcing implementation that separates beam directions from power allocation, reducing computational complexity from $\mathcal{O}(N^{6.5})$ for matrix optimization to $\mathcal{O}(N^2)$ for a two-variable power search.
  - Designed and conducted simulations across security, sensing, and channel-uncertainty regimes, achieving bidirectional protection through native-signal reuse and embedded artificial noise, with no dedicated security hardware.

LEADERSHIP & MENTORSHIP

- **Undergraduate Research Mentorship** Oct. 2025 – Apr. 2026
  - Mentored an undergraduate on DRL-based trajectory optimization for exposure-aware UAV communications, providing end-to-end guidance from literature review to simulation design.

SKILLS

- **Methods:** Optimization Theory, Statistical Signal Processing, Matrix Analysis, Machine Learning
- **Programming & Tools:** Python (PyTorch), MATLAB (CVX), LaTeX
- **Languages:** English (IELTS Academic: 7.5); Mandarin Chinese (native)

HONORS & AWARDS

- First-Class Academic Scholarship, Chongqing University 2024, 2025
- First and Second-Class Academic Scholarship, Sichuan Normal University 2021, 2023
